THOMSON Innovation™

Patent/Publication: AU199884574A Method and system for increasing capacity and improving performance of a cellular network

Bibliographic**DWPI Title**

Performance of cellular telephone network optimising method maintaining and analysing matrices of cell in network with matrix storing performance values and statistics concerning cell and optimising conditions for handoff from cell in response to performance values

English Title

Method and system for increasing capacity and improving performance of a cellular network

Abstract**DWPI Abstract**

(WO1999003245A2)

Novelty

The method involves maintaining performance values concerning the cell. Conditions handoff are adjusted in response to the performance values, the performance values includes frequency of successful handoffs to a second cell of the cellular telephone network, frequency of failed handoffs to the second cell because the second cell was removed from a list of handoff cells, and frequency of failed handoffs to the second cell because the second cell had insufficient resources. The two cell operate on a common frequency and the handoff is a soft handoff. The method maintains status values concerning the cell and adjusts conditions handoff in response to the status values, the status values includes a pilot signal strength measurement for the second cell, and a round trip delay measurement from the second cell to the mobile unit, and the second cell is removed from the list of handoff cells if the pilot signal strength measurement for the second cell falls below a set threshold or if the round trip delay measurement exceeds a set maximum. The status values include a designation available hardware resource of the second cell. A reason for removing the second cell from the list of handoff cells. The status values include a designation of whether the second cell is current, removed, or most recently removed.

Advantage

ADVANTAGEIncreases capacity and improves performance of cellular network by improving conditions for handoff.
